ISSUE 72
July 17, 2026

HART BEAT definitions

The Hart field site has been characterised for plant available water capacity (PAWC) and bulk density to determine how much of the measured water and nitrogen is available to the crop during the season.

Plant available water capacity (PAWC) – is the difference between the drained upper limit of the soil and the lower extraction limit of a crop over the depth of rooting. It is the maximum water available to a crop from a particular soil type.

Plant available water (PAW) – is the amount of water contained in the soil at a given time minus the crop lower limit.

Growing season rainfall (GSR) – is rainfall for the period between and including April to October.

Decile – is a measure of seasonal rainfall on a scale of 1 to 10. In a Decile 7 year, 70% of previous years were

drier, in a Decile 3 year 30% of previous years were drier.

Yield Prophet® is an internet-based service which uses the APSIM wheat prediction model.

The model relies on accurate soil, crop, historical climate data and up to date local weather

information to predict plant growth rates and final hay or grain yields. These are critical measurements specific to the site being analysed and may not fit closely to individual situations. Instead, the predictions will give a realistic guide to seasonal prospects based on a site with similar rainfall and / or soil type.

Using climate data for the current season, *Yield Prophet®* simulates the soil water, nitrogen processes and crop growth in the paddock. *Yield Prophet®* calculates the amount of water and nitrogen available to the crop as well as the water and nitrogen demand of the crop.

Disclaimer: *Yield Prophet®* information is used entirely at your own risk. You will accept all risks and responsibility for losses, damages, costs and other consequences of using *Yield Prophet®* information and reports. To the maximum extent permitted by law, APSRU and BCG excludes all responsibility and liability to any person arising directly or indirectly from using the information generated by *Yield Prophet®*.

Important Notice: *Yield Prophet®* does not generate recommendations or advice; it is only a guide and must be combined with local paddock and district knowledge. APSIM does not take into account weed competition, pest/disease pressure, pesticide / herbicide damage, farmer error, or extreme events (such as extreme weather, flood and fire). Click on these links for more information about [APSIM](#) or [Yield Prophet](#)

Yield Prophet® Lite

A FREE online tool to predict yield potential and manage in-crop nitrogen

Don't have Yield Prophet®?

Yield Prophet® Lite is a free online tool for estimating potential yield values for your crop, taking into account various rainfall scenarios and application rates of nitrogen.

HART BEAT

Date of report: July 17, 2026

Site information

Soil type: Sandy clay loam

Average annual rainfall: 400 mm

Crop growth

Variety: Scepter wheat
Sowing date: May 06, 2026
Emergence: May 15, 2026
Soil sampling date: March 31, 2026
Starting soil N: 96 kg N/ha
Nitrogen fertiliser: 18 kg N/ha @ seeding
+ 80 kg N/ha in-season

The season so far

Annual rainfall to date: 284 mm
GSR to date: 178 mm
Current GSR decile: 7
Initial PAW (March 31): 44 mm
Current predicted PAW: 117 mm (57% full)
PAWC: 206 mm

Yield Prophet® prediction

Based on 96 kg N/ha starting soil,
seeding N + in season applications:
June 12: 30 kg N/ha
June 23: 50 kg N /ha*

The **green** line in the graph above shows the predicted grain yield at Hart for nitrogen-limited yield (PY_N). The **blue** line represents the grain yield potential for water-limited yield (PY_W). No difference between these two lines indicates the current soil N level is adequate for the crop to reach its yield potential. A large difference between these two lines, indicates additional N fertiliser is required for the crop to reach its yield potential. Site characterisation data from APSoil for Hart has been used, and starting soil available nitrogen and water was measured. The red dotted line represents Decile 5 (or 50% probability of receiving 5.4 t/ha nitrogen-limited yield or 5.6 t/ha water-limited yield – refer to below table).

Based on data from the graph above, this table shows the amount of additional N required to close the yield gap between the nitrogen and water-limited yield across a range of decile seasons.

Equivalent decile finish	0	1	2	3	4	5	6	7	8	9	10
PY_N (t/ha)	2.9	3.8	4.3	4.9	5.2	5.4	5.7	6.0	6.0	6.2	6.4
PY_W (t/ha)	2.9	3.8	4.3	4.9	5.2	5.6	6.0	6.3	6.5	6.9	7.4
Yield difference (t/ha)	0	0	0	0	0	0.2	0.3	0.3	0.5	0.7	1.0
Difference in PY_W (t/ha) since last report	0	+ 0.1	- 0.1	0	- 0.1	- 0.2	- 0.1	0	- 0.1	0	- 0.4
N requirement (kg N/ha)	0	0	0	0	0	8	12	12	20	28	40

*Please note in season application from Issue 71 was amended from 60 kg N/ha to 50 kg N/ha.

Measured starting N: 66 kg N/ha
Nitrogen fertiliser: 20 kg N @ seeding
+ 105 kg N/ha in-season

The season so far

GSR to date: 183.1 mm
Estimated GSR decile to date: 7
Initial PAW (April 7): 0 mm
Current predicted PAW: 81 mm (57% full)
PAWC: 143 mm

Yield Prophet®

prediction

Based on 66 kg N/ha starting soil,
seeding N + in season applications:

June 22: 45 kg N/ha

July 17: 60 kg N /ha

The **green** line in the graph above shows the predicted grain yield at Spalding for nitrogen-limited yield (PY_N). The **blue** line represents the grain yield potential for water-limited yield (PY_w). No difference between these two lines indicates the current soil N level is adequate for the crop to reach its yield potential. A large difference between these two lines, indicates additional N fertiliser is required for the crop to reach its yield potential. Site characterisation data from APSoil for Spalding has been used, and starting soil available nitrogen and water was measured. The red dotted line represents Decile 5 (or 50% probability of receiving 4.4 t/ha nitrogen-limited yield or 4.6 t/ha water-limited yield – refer to below table).

Based on data from the graph above, this table shows the amount of additional N required to close the yield gap between the nitrogen and water-limited yield across a range of decile seasons.

Equivalent decile finish	0	1	2	3	4	5	6	7	8	9	10
PY _N (t/ha)	2.4	3.2	3.8	4.0	4.2	4.4	4.6	4.7	4.8	5.0	5.1
